FUNCTION: CATALYZES THE HYDROXYLATION OF ISOFLAVONES, DAIDZEIN AN FORMONOMETIN, TO YIELD 2'-HYDROXYISOFLAVONES, 2'-HYDROXYDAIDZEIN, AND 2'-HYDROXYFORMONOMETIN, RESPECTIVELY (BY SIMILARITY).

CATALYTIC ACTIVITY: FORMONOMETIN + NADPH + O(2) =
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2 IGHLYIL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AMINOPURINE.

PATHWAY: INVOLVED IN THE BIOSYNTHESIS OF LEGUMES.

ANTIMICROBIAL COMPOUNDS OF LEGUMES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Grusalem artichoke. CYPRIBL is a microsomal cytochrome P450 that CC datalyses the omega-2, omega-3 and omega-4 hydroxylation of capric, CC lauric and myristic acids. The major metabolite is the comega-3-hydroxylated compound. The invention provides isolated rucleic acids (see X58400-06) encoding plant fatty acid hydroxylases (see Y05896-902). Also claimed are host cells, transgenic plants and compositions consisting of the plant fatty acid hydroxylase, a process for isolating additional fatty acid hydroxylase, a process for isolating additional fatty acid hydroxylase in a transgenic plant, and a process of altering the fatty acid composition in a plant by expressing the plant fatty acid cydroxylase in a transgenic plant, and hydroxylating or epoxidating a fatty acid substrate in the plant. Manipulating the hydroxylated cattack by insects and other pests. The transgenic plants major action in the manufacture of e.g. lubricants, anti-slip agents, coating acents. Asternants and aurfactants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

antigen region of the full length MAGE sequences. These peptides were used to design the nonapeptides of the invention (see R9937-R99342), which bind to a HLA molecule on a cell, and provoke lysis by cytolytic T cells (CTLs) specific for a complex of the HLA molecule and nonapeptide. The nonapeptides can be used diagnostically to identify tumours expressing a particular HLA molecule, or to identify cancer cells. The peptides can also be used therapeutically to induce a CTL response to tumours (where the peptides are optionally coupled to tumour-specific antibodies), or to induce a response by CTLs that are otherwise inactive. The peptide sequences may also be used to expand specific CTLs in vitro for later return to the patient, such as for treating melanoma. Tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HIA binding peptide; cell lysis; cytolytic T cell; MAGE family; human; tumour rejection antigen precursor; TRA; MAGE-1; tumour; cancer cell; antibody; melanoma; universal effector cell; vaccine; breast cancer; CTL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           R99345 standard; Protein; 9 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 involving HLA-Al subtype cancerous cells. The nucleic acid encoding the nonapeptide can be used as a probe to identify tumour cells. This sequence is homologous to the peptide described and is encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              An isolated nonapeptide having the amino acid sequence Glu-Val-Asp-pro-Ile-Gly-His-Leu-Tyr is derived from the tumour rejection antigen precursor encoded by the MAGE-3 gene and presented by HLA-Al. The nonapeptide can be used in a vaccine to treat a cancerous condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-FEB-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MAGE-21

CC v45390 to y48214 represent specifically claimed immunogenic peptides CC having a human major histocompatibility complex (MHC) Class I (also CK hown as human leukocyte antigen (HLA)) binding motif. The immunogenic CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-2.1, Al, Al. 2 or All. 1 or HLA-B or C) and induce a cytotoxic T cell Cresponse against the antigen from which the peptide is derived. CC control of I lymphocytes (CTLS) which destroy antigen-bearing cells are CC normally induced by an antigen in the form of a peptide fragment bound CC normally important in tumour rejection and in fighting viral CC are particularly important in tumour rejection and in fighting viral CC infections. The peptides are therefore useful therapeutically to treat CC or prevent viral infections and cancers in mammals (especially humans) CC prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in CC cancer, or used to treat chronic or acute conditions. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The non-human transformed cells when polytransformed, are universal effector cells, and can be used in vaccines, or for treating melanoma or breast cancer.
                                                                                                                                                                                                                                                                                                                    and

                                    This peptide is a tumour rejection antigen presented by a HLA-B44 complexed and derived from a MAGE-12 tumour rejection antigen (WR2038443). Consider tumour rejection antigens (WR2038443). Consider the bind to HLA-B44 positive cells, making them useful in identifying cells which present HLA-B44 molecules on their surfaces for use in the diagnosis and therapy of cellular abnormalities. The complex of the tumour rejection antigen and HLA consequence of tumour rejection antigens, or complexes of tumour rejection antigens and that HLA-B44, can be used as vaccines to treat disorders characterised by expression of the TRAP molecule such as cancer, especially melanoma. Vaccines can also be prepared from cells which present the tumour rejection antigen/HLA complexes on their surface, such as non-proliferative cancer cells and non-proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                          WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ₽
                         CC having a human major histocompatibility complex (MHC) Class I (also CC known as human leukocyte antigen (HLA)) binding motif. The immunogenic CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell Cresponse against the antigen from which the peptide is derived. CC cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are commally induced by an antigen in the form of a peptide fragment bound CC to a HLA molecule, rather than the intact foreign antigen itself, and CC are particularly important in tumour rejection and in fighting viral cifections. The peptides are therefore useful therapeutically to treat CC infections. The peptides are therefore useful therapeutically humans) CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CC individuals susceptible or otherwise at risk of viral infection or CC cancer, or used to treat chronic or acute conditions. They are also cuseful diagnostically, and can be used to induce a cytotoxic T cell composure contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The coll contacting the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cance prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                        are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to
                                                                                                                                                                                                                                                 Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and to a HLA molecule, rather than the intact foreign antigen itself, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-DEC-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Y47329 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WO9945954-A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunogenic peptide having
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 13-MAR-1998;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      16-SEP-1999

                                                 CC Y45390 to Y48214 represent specifically claimed immunogenic peptides CC CC having a human major histocompatibility complex (MHC) Class I (also CK nown as human leukocyte antigen (HLA)) binding motif. The immunogenic CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CF HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell cresponse against the antigen from which the peptide is derived. CC Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound CC to a HLA molecule, rather than the intact foreign antigen itself, and CC are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat correct or prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CC Individuals susceptible or otherwise at risk of viral infection or CC cancer, or used to treat chronic or acute conditions. They are also cuseful diagnostically, and can be used to induce a cytotoxic T cell cresponse, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The cC produce CTLs ex vivo for infusion back into a patient. The cC therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Loc

                                              CC v45390 to v48214 represent specifically claimed immunogenic peptides CC having a human major histocompatibility complex (MHC) Class I (also CK known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytocoxic T cell CC response against the antigen from which the peptide is derived. CC Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are CC normally induced by an antigen in the form of a peptide fragment bound CC an HLA molecule, rather than the intact foreign antigen itself, and CC are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat CC or prevent viral infections and canners in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CC They can be administered as vaccines to elicit an immune response in CC individuals susceptible or otherwise at risk of viral infection or CC cancer, or used to treat chronic or acute conditions. They are also CC useful diagnostically, and can be used to induce a cytotoxic T cell CC response, by contacting a cytotoxic T cell with the peptide e.g. to CC produce CTLs ex vivo for infusion back into a patient. The CC polyucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-a subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and the next of the control of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Y46333 standard; Peptide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cance prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                01-DEC-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Y46333
                                                                                                                                                                                                                                                                                                                                                                                                                                                            are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13-MAR-1998;

                                CC having a human major histocompatibility complex (MHC) Class I (also CC known as human leukocyte antigen (HLA)) binding motif. The immunogenic CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell Cryotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are commally induced by an antigen in the form of a peptide is derived. CC crotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are commally induced by an antigen in the form of a peptide irragment bound CC to a HLA molecule, rather than the intact foreign antigen thound CC are particularly important in tumour rejection and in fighting viral CC infections. The peptides are therefore useful therapeutically to treat CC or prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or CC cancer, or used to treat chronic or acute conditions. They are also useful diagnostically and can be used to induce a cytotoxic T cell cresponse, by contacting a cytotoxic T cell with the peptide e.g. to CC produce CTLs ex vivo for infusion back into a patient. The CC therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tunour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;

                                                                                                                                                                                                                                                                                                                                                                                                            CC vat5390 to v48214 represent specifically claimed immunogenic peptides CC having a human major histocompatibility complex (MHC) Class I (also CC known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell C response against the antigen from which the peptide is derived. CC Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are constaintly induced by an antigen in the form of a peptide fragment bound CC to a HLA molecule, rather than the intact foreign antigen itself, and care particularly important in tumour rejection and in fighting viral confections. The peptides are therefore useful therapeutically to treat cor prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C. AIDS, and renal carcinoma. CC They can be administered as vaccines to elicit an immune response in C individuals susceptible or otherwise at risk of viral infection or CC cancer, or used to treat chronic or acute conditions. They are also cuseful diagnostically, and can be used to induce a cytotoxic T cell C response, by contacting a cytotoxic T cell with the peptide e.g. to CC produce CTLs ex vivo for infusion back into a patient. The cc therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;

Y48011
                          CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes (HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell CC response against the antigen from which the peptide is derived. CC Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound CC to a HLA molecule, rather than the intact foreign antigen itself, and CC are particularly important in tumour rejection and in fighting viral CC infections. The peptides are therefore useful therapeutically to treat C or prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C, ALDS, and renal carcinoma. CC They can be administered as vaccines to elicit an immune response in CC individuals susceptible or otherwise at risk of viral infection or CC cancer, or used to treat chronic or acute conditions. They are also CC response, by contacting a cytotoxic T cell with the peptide e.g. to CC produce CTLs ex vivo for infusion back into a patient. The CC custometrically and for immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;

                                                                                                                                                                                                                                                                                                                        B08827-37 represent melanoma associated antigen (MAGE)-3 derived immunogenic peptides. The peptides are capable of binding to major histocompatibility complex (MHC) class II molecules. Stimulation with the peptides induces proliferation of CD4+ T cells, and of their cytolytic activity. CD4+ T cells exposed to the peptides were able to cause lysis of melanoma cells expression MAGE-3 and HLA-DR molecules. The peptides are useful for inducing an immune response against tumour cells expressing a MAGE-3 antigen. They are also useful for the preparation of anti-tumour medicament for use as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Melanoma associated antigen-3; MAGE-3; immunogenic peptide; major histocompatibility complex; MHC; class II molecule; tumour; CD4+ T cell proliferation; melanoma cell; immune response; vaccine

X-RAY CRYSTALLOGRAPHY (2.0 ANGSTROMS) OF 35-210.

MEDLINE-99036858; PubMed-9817840;

Olltsch M., Lokker N.A., Godowski P.J., de Vos A.M.;

"Crystal structure of the NK1 fragment of human hepatoc;
factor at 2.0-A resolution.";

Structure 6:1383-1393(1998):

-i- FUNCTION: HGF IS A POTENT MITOGEN FOR MATURE PARENCI
HEPATOCYTE CELLS, SEEMS TO BE AN HEDATOTROPHIC FACTO
AS GROWTH FACTOR FOR A BROAD SPECTRUM OF TISSUES ANI
IT HAS NO DETECTABLE PROTEASE ACTIVITY.

-I- SUBUNIT: DIMER OF AN ALPHA CHAIN AND A BETA CHAIN L.

C -: FUNCTION. HGF IS A POTENT MITOCEN FOR MATURE PARENCHYMAL HEPATOCYTE CELLS, SEEMS TO BE AN HEPATOTROPHIC FACTOR, AND ACTS AS GROWTH FACTOR FOR A BROAD SPECTROM OF TISSUES AND CELL TYPES.

AS GROWTH FACTOR FOR A BROAD SPECTROM OF TISSUES AND CELL TYPES.

C IT HAS NO DETECTABLE PROTEASE ACTIVITY.

C -: SUBUNIT: DIMER OF AN ALPHA CHAIN AND A BETA CHAIN LINKED BY A DISULFIDE BOND.

C -: SIMILARITY: DELONGS TO PEPTIDASE FAMILY SI; ALSO KNOWN AS THE STANDARD CONTAINS 4 KRINGLE REGIONS.

BINDS POLY (RG). SUBCELLULAR LOCATION: NUCLEAR; NUCLEOPLASM.

**TISSUE SPECIFICITY: EXPRESSED UBIODITOUSLY.

**DOMAIN: BACH QUASI-RRM REPEAT BOUND POLY(RG), WHILE ONLY THE N-TERMINAL QRAM BOUND POLY(RC) AND POLY (RU). NONE OF THE REPEATS BOUND DETECTABLE AMOUNTS OF POLY(RA).

**SIMILARITY: CONTAINS 3 RNA RECOGNITION MOTIFS (RRM).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   VYMGHLYI

RT "Heterogeneous nuclear ribonucleoproteins H, H', and F are members of
RT a ubiquitously expressed subfamily of related but distinct proteins
RT encoded by genes mapping to different chromosomes.";
RL J. Biol. Chem. 270:28780-28789(1995)
C.-: FUNCTION: THIS PROTEIN IS A COMPONENT OF THE HETEROGENOUS NUCLEAR
C.-: RIBONUCLEOPROTEIN (HNRNP) COMPLEXES WHICH PROVIDE THE SUBSTRATE
C. FOR THE PROCESSING EVENTS THAT PRE-MRNAS UNDERGO BEFORE BECOMING
CC. FUNCTIONAL, TRANSLATABLE MRNAS IN THE CYTOPLASM. BINDS POLY (RG).
C. C. SUBCELLULAR LOCATION: NUCLEAR; NUCLEOPLASM.
C. C. SUBCELLULAR LOCATION: NUCLEAR; NUCLEOPLASM.
C. SUBCELLULAR LOCATION: EXPRESSED UBIQUITOUSLY.
C. SIMILARITY: CONTAINS 3 RNA RECOGNITION MOTIFS (RRM).
